the modern society is rapidly becoming a fully digital society this has many benefits but unfortunately it also means that personal privacy is threatened the threat does not so much come from a 1984 style big brother but rather from a set of smaller big brothers the small big brothers are companies that we interact with they are public services and institutions many of these little big brothers are indeed also being invited to our private data by ourselves privacy as a subject can be problematic at the extreme it is personal freedom against safety and security we shall not take a political stand on personal privacy and what level of personal freedom and privacy is the correct one aspects of personal privacy in communications is mostly about understanding what privacy is and some of the technologies may help us to regain a bit of privacy we discuss what privacy is about what the different aspects of privacy may be and why privacy needs to be there by default there are boundaries between personal privacy and societal requirements and inevitably society will set limits to our privacy lawful interception etc there are technologies that are specifically designed to help us regain some digital privacy these are

commonly known as privacy enhancing technologies. We investigate some of these technologies including mix networks, onion routing and various privacy preserving methods. Other aspects include identity and location privacy in cellular systems, privacy in RFID, Internet of Things (IoT) and sensor networks. Amongst others, some aspects of cloud systems are also covered.

Over the next several decades, as human populations grow, the demand for energy will soar, but renewable energy sources have a large energy sprawl. The amount of land needed to produce energy, which can threaten biodiversity in energy sprawl, is a significant concern. Scientists Joseph M. Kiesecker and David Naugle provide a roadmap for preserving biodiversity despite the threats of energy sprawl. Their strategy, development by design, identifies and sets aside land where biodiversity can thrive while consolidating development in areas with lower biodiversity value. This contributed volume features case studies from countries around the world, each describing a different energy sector and the way they have successfully maximized biodiversity protection. This book provides a needed guide for elected officials, industry representatives, NGOs and community groups who have a stake in sustainable energy development planning.

This volume examines the applicability of nature-based solutions in ecological restoration practice and in contemporary landscape architecture by bringing together ecology and architecture in the built environment. Green infrastructure is used to address urban challenges such as climate change adaptation, disaster risk reduction and stormwater management. In addition, thermal comfort, nature-based solutions, reintroduce critical connections between natural and urban systems in light of ongoing developments in sustainable urban development. The goal is a paradigm shift towards a landscape that restores and rehabilitates urban ecosystems. The ten contributions to this book examine a wide range of successful cases of designing healthier, greener and more resilient landscapes in different geographical contexts from the United States of America and Brazil through various European regions to Singapore and China. While some chapters attempt to conceptualize the interconnections between cities and nature, others clearly have an empirical focus. Therefore, this volume provides a rich body of work and acts as a starting point for further studies on restoration of ecosystems and integrative policies such as the United Nations Sustainable Development Goals.
